

# A novel algorithm for demand-control of a single-room ventilation unit with a rotary heat exchanger

Kevin Michael Smith

Post-doc researcher,

Technical University of Denmark

# Ventilation for renovated apartments

## Centralized

- No space for ductwork
- Difficult to plan and install

## Single-room ventilation

- Drilled installation
- Low fan power
- Local control of heat recovery

- Development with DTU: Rotary H.Ex. (Breathe 55) & Plate H.Ex. (Spiralflow)

# Single-room unit w/ Rotary Heat Exchanger

Variable-speed fans

Sensors

- Temperature, CO2, RH in exhaust
- Temperature at all inlets/outlets

Plastic rotary heat exchanger

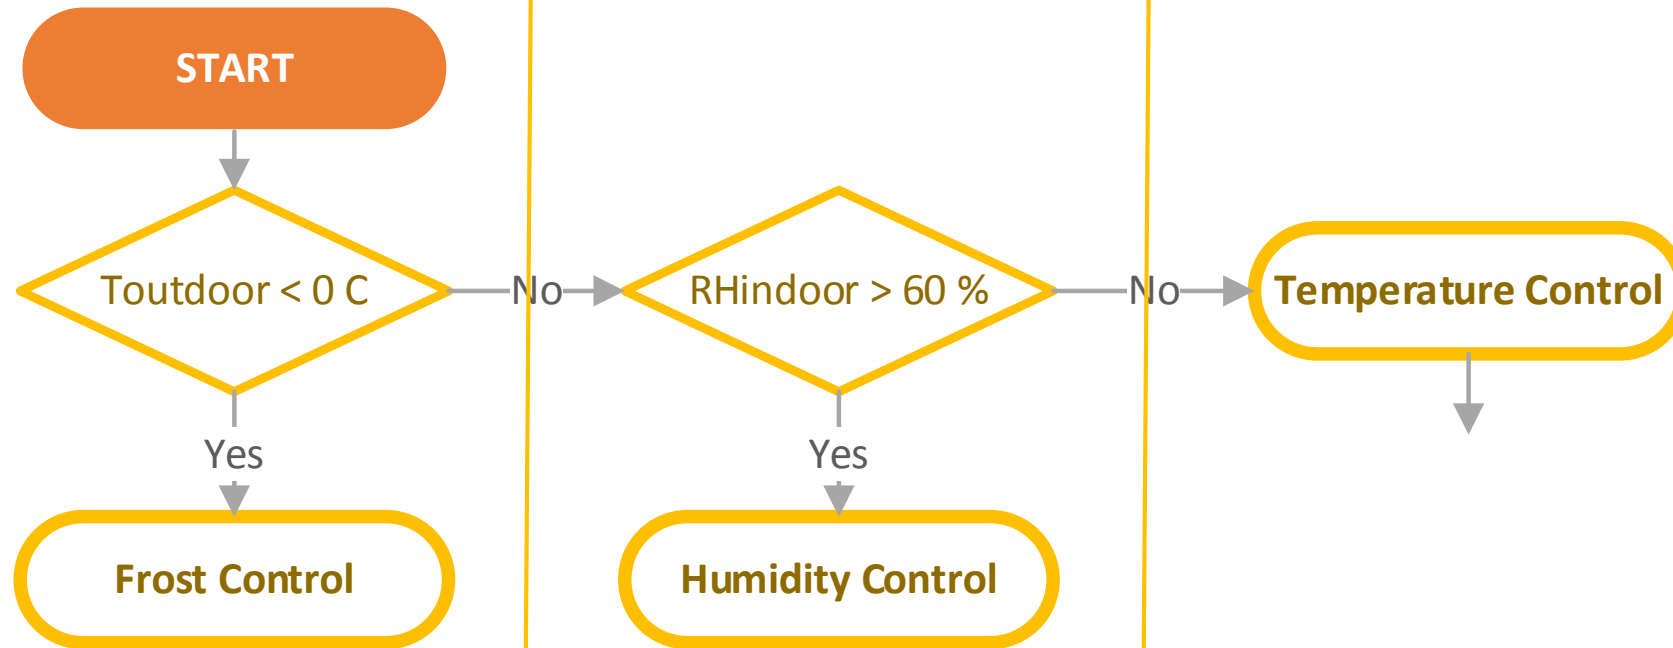

- > 80% eff. @ 8 L/s
- Variable-speed drive
- Recovers heat and condensation
- Intended for dry rooms

Not drawn to scale.

# Three control modes (priority from L to R)

Frost protection → Humidity control → Temperature control

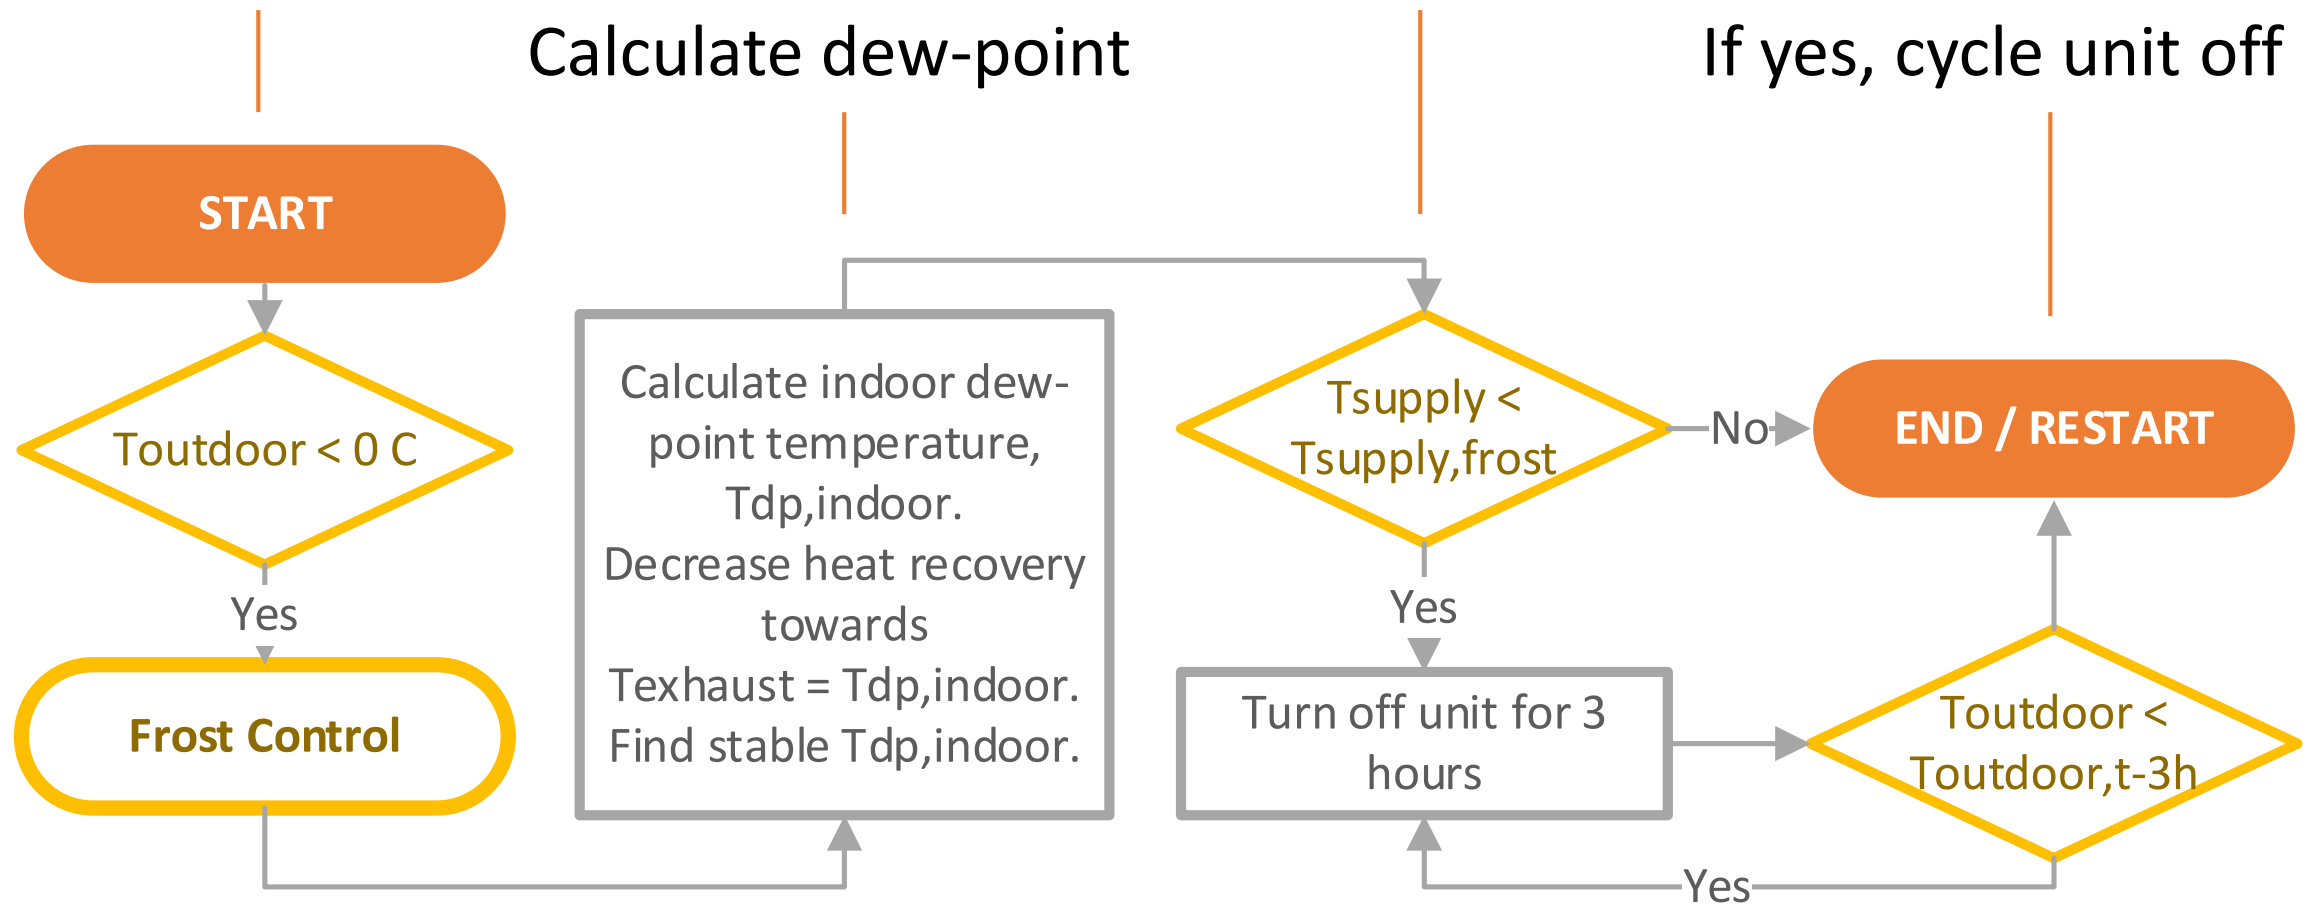

# 1st priority: Frost control

Below 0°C outside?

Is supply air too cold?

Calculate dew-point

If yes, cycle unit off

# 2nd priority: Moisture control

Humid indoors?

Yes

Reduce coupled heat + H<sub>2</sub>O recovery

Still too humid?

RHindoor > 70 %

Yes

STILL too humid?

RHindoor > 85 %

Yes

Probably a kitchen. Boost exhaust.

No

No

END / RESTART

# 3rd priority: Temperature control

Unknown set-point on room thermostat

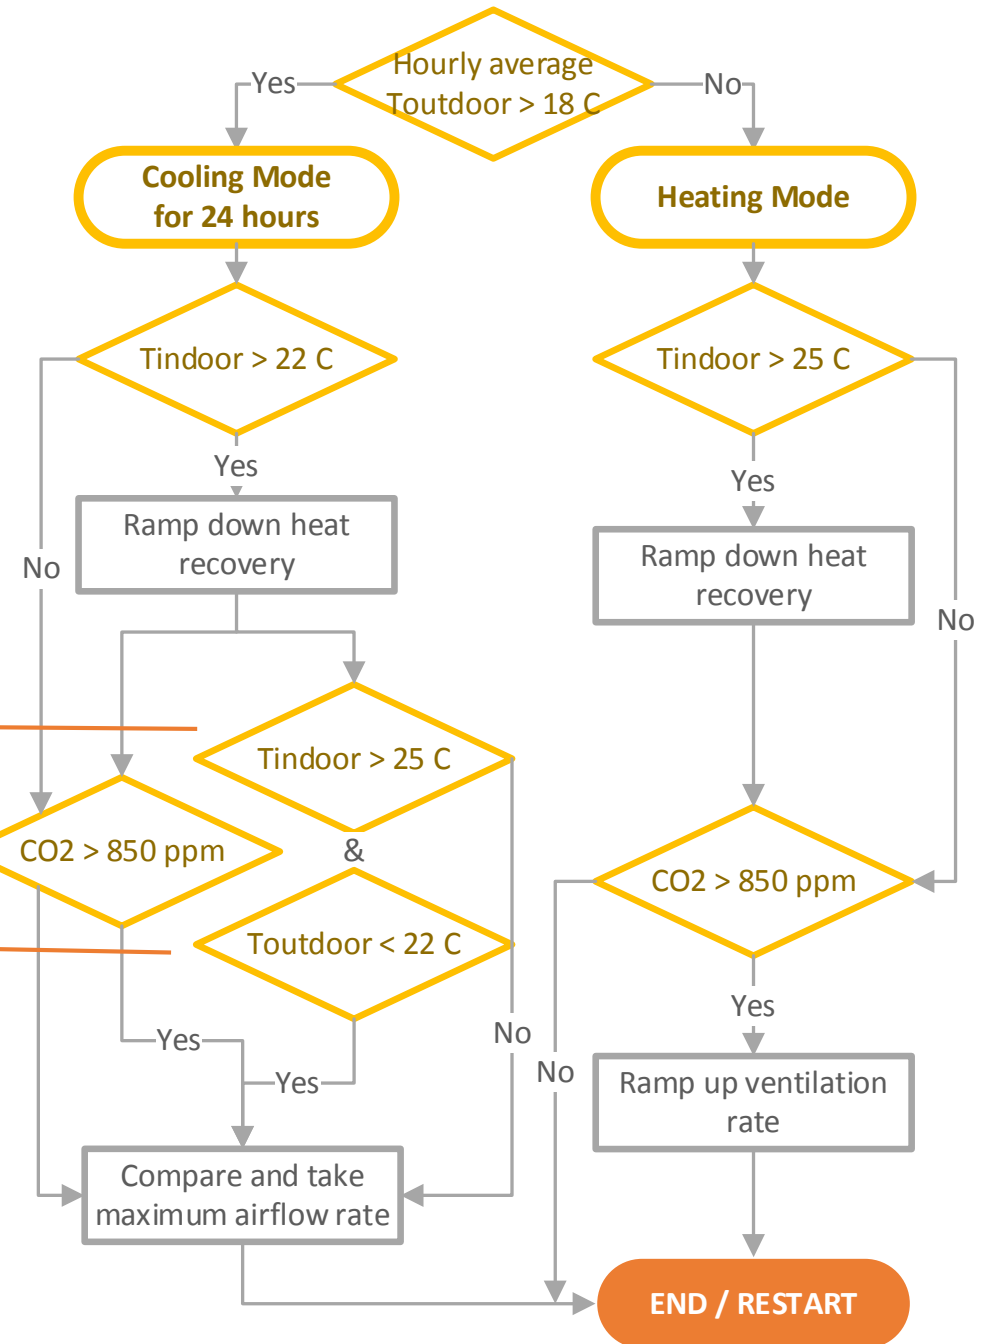

Too warm? Decrease heat recovery.

Cooling mode: Too warm? More airflow.

Poor IAQ, too-high CO<sub>2</sub>? More airflow!

Is there cooling potential?

Take the highest demand for airflow

# Current activities & next steps

- Algorithm written in C code, installed in commercial units
- Simulating controls in IDA-ICE
- Experimental tests
  - Between chambers
  - Test offices at DTU

Thanks for your attention.

# Uncoated rotary heat ex. (a.k.a. Heat Wheel)

Drying capacity = 1.76 g H<sub>2</sub>O per kg AIR

# Concept for a demand-controlled system

## Use existing direct exhaust from 'wet rooms'

- Central rooftop fan + local VAV dampers
- Bathroom
  - Adjusts according to RH
  - From fully-closed up to > 15 L/s
- Kitchen
  - Boosted by high humidity & temperature
  - From fully-closed up to > 20 L/s

## Kitchen single-room rotary unit

- Background ventilation of 0.3 L/s/m<sup>2</sup>
- Increased airflow according to CO<sub>2</sub> + RH
- Temperature control on heat recovery
